

Cumming School of Medicine

Evolution of variable mutative organisms Summary of Literature

Oliver A.S. Lyon
2021

Supervisor: Dr. Jason de Koning

1 Project Outline

A project proposal may or may not appear here. It depends on how private the material should be.

2 References Discussion

This section is intended for me to write notes connecting the material in the references with observations and comments.

- ’This paper covers a neural net work that uses the amino acid sequence of differnt protiens to produce a evolutionary index. The evolutionary index is then used to produce a distribution of of differnt sequences and make a prediction of Benign, unknowen, and Pathogenic: The distribution allows for an estimate of the confidence of the prediction. They used unsupervised learning and were able to achive an avg AUC = 0.92’
